PROJECT OBJECTIVE

This report analyses a synthetic fake Samsung e-commerce dataset covering January–June 2025, the original dataset was created using AI.

The objective is to monitor sales performance, customer conversion and promotional effectiveness across products, divisions and channels.

TOOLS AND METHODS

- Small portion of data cleaning (data was already cleaned due to AI creation)
- Star-schema data modelling
- Calendar table and date hierarchy
- DAX measures and filter context
- Interactive slicers and graphs with drill down option
- Conditional formatting

LIMITATIONS

- The dataset is synthetic and does not represent real business data. The purpose of this project is primarily to demonstrate my ability to use Power BI as a reporting and analysis tool.
- The dataset was not originally created for this specific type of analysis, so the insights are limited. In a real e-commerce dataset, we would expect to see more meaningful differences in conversion rates and funnel performance across product categories and retailers.

For example, Amazon would likely show a higher Add-to-Cart Rate than other retailers, due to factors such as a more reliable shipping network, easier return policies, and a higher share of users who already have an account or previous purchase history.
Similarly, Home Appliances, especially large products, would generally be expected to have lower conversion rates than other product categories, because they are higher-consideration purchases.

KEY INSIGHTS & OBSERVATIONS

- The overall conversion rate was 1.85%, meaning that approximately 2 purchases were completed for every 100 visits.
- The revenue peak on May 24 does not appear to have been driven by any promotional activity. By contrast, the lower revenue levels observed in February seem to be mainly explained by lower traffic, although conversion rate also showed a slight decrease.
- The impact of promotions varied considerably across products. Most products generated higher daily revenue during promotional periods, while others showed only limited uplift, with only one product recording a negative impact.
- Audio Video appears to be the product category with the highest promotional profitability, while Home Appliances promotions seem to have had a weaker effect on revenue, mainly due to higher average discount levels.
